Introduction to ASHRAE 55-2010

Overview of the Standard

ASHRAE Standard 55-2010, titled "Thermal Environmental Conditions for Human Occupancy," sets forth criteria for thermal comfort that can be consistently achieved in residential, commercial, and institutional buildings. Published by the American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE), this standard aims to define acceptable indoor environmental conditions based on occupant feedback and scientific research.

The 2010 revision introduces updates from previous versions, emphasizing a more comprehensive approach to thermal comfort that considers a broader range of variables and occupant diversity. It integrates both physical environmental parameters and personal factors, providing a holistic framework for designing and evaluating indoor spaces.

Scope and Purpose

The primary goal of ASHRAE 55-2010 is to establish conditions that will satisfy the majority of occupants ? typically at least 80% ? under specified environmental parameters. It serves as a benchmark for assessing existing indoor climates and guiding new building designs, retrofits, and HVAC system operations.

The document covers various aspects, including temperature, humidity, airflow, clothing insulation, activity levels, and personal control. Its flexible approach allows designers to tailor solutions to diverse building types and occupant needs while maintaining comfort standards.

Key Components and Provisions of ASHRAE 55-2010

Thermal Parameters and Comfort Zone

A core feature of ASHRAE 55-2010 is the definition of the "thermal comfort zone" ? the range of environmental conditions where most occupants find the environment acceptable. These parameters include:

- Air Temperature: Typically between 20°C and 24°C (68°F to 75°F), depending on activity level and clothing.
- Mean Radiant Temperature (MRT): Usually within a few degrees of air temperature, accounting for radiant heat exchange.
- Humidity: Relative humidity levels maintained between 30% and 60% to prevent discomfort and mold growth.

- Air Velocity: Generally kept below 0.2 m/s (about 40 ft/min) to prevent drafts.

The standard emphasizes that comfort is multidimensional, influenced by the interaction of these factors.

Metabolic Rate and Clothing Insulation

Recognizing individual differences, ASHRAE 55-2010 incorporates variables such as:

- Metabolic Rate: Ranges from sedentary (e.g., office work) to more active conditions.
- Clothing Insulation: Varies based on clothing ensembles, typically ranging from 0.5 to 1.0 clo.

Adjustments to these parameters allow tailoring of the comfort zone to specific populations or activities.

Adaptive Comfort Model

One of the significant updates in the 2010 version is the expanded discussion on the adaptive comfort model. It reflects the idea that occupants in naturally ventilated or less controlled environments may accept a broader range of conditions, influenced by their adaptive behaviors and expectations.

This model considers factors such as:

- Outdoor climate
- Building design and operation
- Cultural expectations

It enables practitioners to justify wider comfort ranges in sustainable or naturally ventilated buildings.

Measurement and Evaluation

The standard provides guidance on how to measure environmental parameters accurately and interpret occupant feedback. It advocates for:

- Using calibrated sensors
- Conducting occupant surveys
- Applying statistical methods to assess comfort levels

This comprehensive approach helps ensure that the design or retrofit meets occupant needs effectively.
